

Do you think one can rely on Russians that they will not some day disconnect us from the gas for good, and we will remain so without heat?

Or do you think Slovakia will quickly find another transit for gas, or more precisely other suppliers without impact on you??

Or do you think the price of gas from the Russians will be sinking?

Or do you still think a new special heating will be invented, acting as a substitute for gas, and which would be inexpensive financially?

We do NOT think so and the best way is to always incline to the proved alternative method of heating, and if you want to save on fuel - wood, so move towards the original grateless radiating stove with feeding for example 2x a day!! In some cases the stove can be changed from alternative heating to the main heating.
